Introduction to Microsoft AI models

1) Microsoft AI models

1. Which model should you evaluate for a chat application that must solve complex, multi-step problems?

MAI-Thinking-1 ✓

MAI-Transcribe-1.5

MAI-Image-2.5

2. Which model is optimized for efficient agentic coding workflows in GitHub Copilot?

MAI-Code-1.1-Flash ✓

MAI-Thinking-1

MAI-Voice-2-Flash

3. You're building an interactive voice assistant where fast spoken responses are more important than maximum long-form fidelity. Which model is the best starting point?

MAI-Voice-2

MAI-Voice-2-Flash ✓

MAI-Transcribe-1.5

4. Which MAI-Image-2.5 variant should you evaluate first when strong object consistency and visual reasoning are the highest priorities?

MAI-Image-2.5-Flash

MAI-Image-2.5

MAI-Image-2.5-Pro ✓

2) Microsoft AI models in Foundry

1. Which Foundry resource should you review first to understand a model's intended uses, limitations, and deployment options?

The model card ✓

The deployment endpoint

The application trace log

2. Which model should you evaluate for an application that must analyze a complex problem through multiple reasoning steps?

MAI-Thinking-1 ✓

MAI-Transcribe-1.5

MAI-Voice-2-Flash

3. You're building an interactive voice assistant. Which combination provides speech input and a low-latency spoken response?

MAI-Transcribe-1.5 and MAI-Voice-2-Flash ✓

MAI-Image-2.5 and MAI-Voice-2

MAI-Thinking-1 and MAI-Image-2.5-Flash

3) Microsoft AI Code model for AI-assisted coding

1. Which task is an MAI-Code model designed to support?

Planning and implementing a change across multiple source files ✓

Replacing human review for every generated change

Guaranteeing that generated code has no security vulnerabilities

2. What should you include in a prompt to help an MAI-Code model produce a useful implementation?

Only the name of the programming language

Requirements, relevant context, constraints, and expected validation ✓

A request to make any changes it considers appropriate

3. After an MAI-Code model generates an application, what should you do before accepting the result?

Review the changes and run relevant tests and checks ✓

Assume the application is correct because the model specializes in code

Deploy the application before examining the generated dependencies
